2021-2022 Pre budget submission: a ‘green recovery’ is win-win-win for Australia

My small business works locally, nationally and globally to articulate opportunities for environmental and societal win-win outcomes

COVID-19 has seen the government follow science over ideology and this has won a greatly increased approval rating from the Australian public

COVID-19 has seen the government borrow to support our community and to invest out of the economic recession, to the general approval of the Australian public

Science unequivocally concludes that Australia needs to drastically reduce its carbon emission and erosion of biodiversity in order to stabilise the climate and quality of life of everyday Australians

Health professionals are increasingly measuring the risk of climate change, such as extreme heat days, on the health of individual Australians

Economic models repeatedly demonstrate very impressive cost-benefit ratios from investments in sustainable ‘green recovery’ options, whereas investments in fossil fuel extraction often have negative cost-benefit ratios

Parents and school children are speaking on behalf of future generations for the need to avert a climate disaster

Global institutions (which are largely free of lobbying by the fossil fuel industry) have resolutely called for investment in a ‘green recovery’ to the COVID-recession

A ‘green recovery’ can improve Australia’s economy, health and environment – a triple-win for Australians and the government. The Australian people expect to see leadership from government in this year’s budget
